MDM9x35 + Third-Party Apps Processor (AP)

MDM9x35 TN

- RIL
 - The RIL interface may vary depending on the HLOS, e.g., Android™, Windows Mobile, etc.; Android is the example in the diagram.
 - Communication between the AP and the modem can be a QMI or an AT command, etc. It is recommended that customers use QMI.
- QMI message library
 - The QMI message library is used to encode/decode QMI messages.
 - QTI provides a QMI message library for reference; it does not cover all QMI messages.
- Qmux
 - Qmux multiplexes QMI messages against different services, i.e., voice, SMS, etc.

QMI Control Path

- QMI control path
 - QMI on third-party AP ↔ PCIe driver on third-party AP ↔ PCIe driver on A7 ↔ SMD bridge on A7 ↔ SMD on Q6 ↔ QMI services on Q6
- AP-side PCIe driver
 - There is an open source PCIe driver for the QTI hardware platform

RmNet Data Path

- Data path
 - Data app on third-party AP ↔ PCIe driver on third-party AP ↔ PCIe driver on A7 ↔ IPA driver on Q6 ↔ RmNet on Q6
- PCIe driver
 - There is an open source PCIe driver for the QTI hardware platform

RIL/QMI Implementation Guide

- RIL
 - Assume that OEMs are working on Android as the third-party AP
 - Two sets of RIL commands
 - Solicited commands are originated by the RIL library, i.e., DIAL and HANDUP
 - Unsolicited responses are originated by baseband, i.e., CALL_STATE_CHANGED and NEW_SMS
 - QMI clients are used to communicate with QMI services on the modem side, e.g., voice, SMS, etc.
 - Initializes the RmNet data path for data calls
- QMI message library
 - QMI message format specifications are available for customers
 - Encodes/decodes QMI message
- Qmux
 - Qmux header format specifications are available for customers
 - Uses service ID to multiplex QMI messages
 - Encode/decode the Qmux header
