1 Introduction

1.1 Purpose

This specification documents Major Version 1 of the Qualcomm Messaging Interface (QMI) for the Authentication Service (QMI_AUTH).

QMI_AUTH provides a command set to interface to a wireless mobile station to access some authentication services. QMI_AUTH is a QMI service within the QMI framework defined in 80-VB816-1.

1.2 Scope

This document is intended for QMI clients to perform authentication-related operations with Qualcomm MSMTM devices from a host processor.

This document provides the following details about QMI_AUTH:

- Theory of operation Chapter 2 provides the theory of operation of QMI_AUTH. The chapter
 includes messaging conventions, assigned QMI service type, fundamental service concepts, and state
 variables related to the service.
- Message formats, syntax, and semantics Chapter 3 provides the specific syntax and semantics of messages included in this version of the QMI_AUTH specification.

1.3 Conventions

Function declarations, function names, type declarations, and code samples appear in a different font, for example, #include.

1.4 Technical Assistance

For assistance or clarification on information in this document, submit a case to Qualcomm Technologies at https://support.cdmatech.com.

If you do not have access to the CDMATech Support website, register for access or send email to support.cdmatech@qti.qualcomm.com.

2 Theory of Operation

2.1 Generalized QMI Service Compliance

The QMI_AUTH service complies with the generalized QMI service specification, including the rules for messages, indications and responses, byte ordering, arbitration, constants, result, and error code values described in 80-VB816-1. Extensions to the generalized QMI service theory of operation are noted in subsequent sections of this chapter.

2.2 AUTH Service Type

AUTH is assigned QMI service type 0x07.

2.3 Message Definition Template

2.3.1 Response Message Result TLV

This Type-Length-Value (TLV) is present in all Response messages defined in this document. It is not present in the Indication messages.

Name	Version introduced	Version last modified
Result Code	Corresponding	Corresponding
	response's Version	response's Version
	introduced	last modified

Field	Field	Field	Parameter	Size	Description
	value	type		(byte)	
Туре	0x02			1	Result Code
Length	4			2	
Value	\rightarrow	uint16	qmi_result	2	Result code
					• QMI_RESULT_SUCCESS
					• QMI_RESULT_FAILURE
		uint16	qmi_error	2	Error code – Possible error code values
					are described in the error codes section
					of each message definition

2.4 QMI_AUTH Fundamental Concepts

The QMI_AUTH service provides authentication and session key distribution using the Extensible Authentication Protocol (EAP) mechanism.

2.4.1 EAP-AKA

EAP is a mechanism for authentication and session key distribution that uses the Authentication and Key Agreement (AKA) mechanism. AKA is used in the third generation mobile networks Universal Mobile Telecommunications System (UMTS) and cdma2000[®]. AKA is based on symmetric keys and typically runs in a Subscriber Identity Module (SIM), which is a UMTS Subscriber Identity Module (USIM) or a Removable User Identity Module (R-UIM), similar to a smart card.

2.4.2 **EAP-SIM**

EAP is also a mechanism for authentication and session key distribution using the Global System for Mobile Communications (GSM) SIM. GSM is a second generation mobile network standard. The EAP-SIM mechanism specifies enhancements to GSM authentication and key agreement whereby multiple authentication triplets can be combined to create authentication responses and session keys of greater strength than the individual GSM triplets. The mechanism also includes network authentication, user anonymity support, result indications, and a fast re-authentication procedure.

2.4.3 EAP Support

QMI_AUTH service enables clients to use the wireless mobile station for EAP authentication. Figure 2-1 illustrates a sample QMI_AUTH call flow.

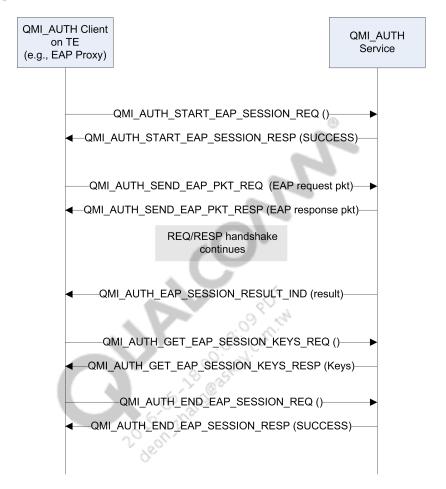

Figure 2-1 QMI AUTH sample call flow

2.5 EAP Session Handle

The QMI_AUTH_START_EAP_SESSION_REQ message creates an EAP instance and stores the EAP handle. The same handle is used internally when the QMI_AUTH_SEND_EAP_PACKET command is issued. The EAP handle is deleted when the QMI_AUTH_END_EAP_SESSION command is issued.

2.6 Service State Variables

2.6.1 Shared State Variables

No QMI_AUTH state variables are shared across control points.

2.6.2 State Variables Per Control Point

Name	Description	Possible values	Default value
report_eap_notification_code	Whether an EAP notification code	• FALSE	FALSE
	is reported to a control point	• TRUE	
	Jeon Inang@askey.com.tw		

3 QMI_AUTH Messages

Table 3-1 QMI_AUTH messages

Command	ID	Description
QMI_AUTH_RESET	0x0000	Resets the client.
QMI_AUTH_INDICATION_REGISTER	0x0003	Sets the registration state of the
		QMI_AUTH indication for the
		requesting control point.
QMI_AUTH_GET_SUPPORTED_MSGS	0x001E	Queries the set of messages
		implemented by the currently running
	0.0017	software.
QMI_AUTH_GET_SUPPORTED_FIELDS	0x001F	Queries the fields supported for a single
	.09 15	command as implemented by the
ON III ANTENI GENERAL ELA DI GEOGRANIA	0.0000	currently running software.
QMI_AUTH_START_EAP_SESSION	0x0020	Starts the EAP session.
OM AVEN GENE EAR DAGNET	0.0001	G I I I I FAD I
QMI_AUTH_SEND_EAP_PACKET	0x0021	Sends and receives EAP packets.
QMI_AUTH_EAP_SESSION_RESULT_IND	0x0022	Communicates the result of the EAP
2,501,		session.
QMI_AUTH_GET_EAP_SESSION_KEYS	0x0023	Queries the EAP session keys.
QMI_AUTH_END_EAP_SESSION	0x0024	Ends the EAP session.
QMI_AUTH_RUN_AKA_ALGO	0x0025	Runs the AKA algorithm.
QMI_AUTH_AKA_ALGO_RESULT_IND	0x0026	Communicates the result of the AKA algorithm.
QMI_AUTH_SET_SUBSCRIPTION_BINDING	0x0027	Associates the requesting control point
		with the requested subscription.
QMI_AUTH_GET_BIND_SUBSCRIPTION	0x0028	Queries the subscription associated with
		the control point.
QMI_AUTH_EAP_NOTIFICATION_CODE_	0x0029	Provides a notification code from the
IND		EAP server to the requested control
		point.

3.1 QMI AUTH RESET

Resets the client.

AUTH message ID

0x0000

Version introduced

Major - 1, Minor - 0

3.1.1 Request - QMI_AUTH_RESET_REQ

Message type

Request

Sender

3.1.2 Response - QMI_AUTH_RESET_RESP

Message type

Response

Sender

Service

Mandatory TLVs

The Result Code TLV (defined in Section 2.3.1) is always present in the response.

Optional TLVs

None

Error codes

QMI_ERR_NONE	No error in the request

3.1.3 Description of QMI_AUTH_RESET REQ/RESP

This command resets the state of the requesting control point. The command clears all the resources that were set up for the EAP session started by the control point.

QMI AUTH INDICATION REGISTER 3.2

Sets the registration state of the QMI_AUTH indication for the requesting control point.

AUTH message ID

0x0003

Version introduced

Major - 1, Minor - 7

Request - QMI_AUTH_INDICATION_REGISTER_REQ 3.2.1

			code		• 0 – Do not report
					• 1 – Report the error

Response - QMI_AUTH_INDICATION_REGISTER_RESP 3.2.2

Message type

Response

Sender

Service

Mandatory TLVs

The Result Code TLV (defined in Section 2.3.1) is always present in the response.

Optional TLVs

None

Error codes

QMI_ERR_NONE	No error in the request
QMI_ERR_MISSING_ARG	Required TLV was missing from the request
QMI_ERR_MALFORMED_MSG	Message was not formulated correctly by the control point,
	or the message was corrupted during transmission
QMI_ERR_INVALID_ARG	Value field of one or more TLVs in the request message
	contains an invalid value

3.2.3 Description of QMI_AUTH_INDICATION_REGISTER REQ/RESP

This command registers/deregisters different QMI_AUTH indications. The control point's event reporting state variables are modified according to the settings specified in the TLVs included in the request message.

If the EAP Session Error Notification TLV is enabled, the control point receives the EAP server notification codes via the QMI_AUTH_EAP_NOTIFICATION_CODE_IND indication.

3.3 QMI AUTH GET SUPPORTED MSGS

Queries the set of messages implemented by the currently running software.

AUTH message ID

0x001E

List of Supported Messages	1.6	1.6	

Field	Field	Field	Parameter	Size	Description
	value	type		(byte)	
Туре	0x10			1	List of Supported Messages
Length	Var			2	(a)
Value	\rightarrow	uint16	supported_msgs_len	2	Number of sets of the following
					elements:
					• supported_msgs
		uint8	supported_msgs	Var	This array of uint8 is a bitmask where
					each bit represents a message ID, i.e.,
					starting with the LSB, bit 0 represents
				3	message ID 0, bit 1 represents message
					ID 1, etc.
				_	The bit is set to 1 if the message is
				80	supported; otherwise, it is set to zero.
				.000	For example, if a service supports
			0.0	, , ,	exactly four messages with IDs 0, 1, 30,
			00,	57	and 31 (decimal), the array (in
			7,000		hexadecimal) is 4 bytes [03 00 00 c0].

Error codes

QMI_ERR_NONE	No error in the request
QMI_ERR_INTERNAL	Unexpected error occurred during processing
QMI_ERR_NO_MEMORY	Device could not allocate memory to formulate a response
QMI_ERR_INFO_UNAVAILABLE	Information is not available

3.3.3 Description of QMI_AUTH_GET_SUPPORTED_MSGS REQ/RESP

This command queries the set of messages implemented by the currently running software. This may be a subset of the messages defined in this revision of the service.

QMI AUTH GET SUPPORTED FIELDS 3.4

Queries the fields supported for a single command as implemented by the currently running software.

AUTH message ID

Result Code	1.6	1.7

Optional TLVs

Name	Common version	Common version
	introduced	last modified
List of Supported Request Fields	1.6	1.6
List of Supported Response Fields	1.6	1.6
List of Supported Indication Fields	1.6	1.6

Field	Field	Field	Parameter	Size	Description
	value	type	0.	(byte)	
Туре	0x10		00.	₹ ³ 1	List of Supported Request Fields
Length	Var		100 mg	2	
Value	\rightarrow	uint8	request_fields_len	1	Number of sets of the following elements: • request_fields
		uint8	request_fields	Var	This field describes which optional field IDs are supported in the QMI request. The array of uint8 is a bitmask where each bit represents a field (TLV) ID. Because fields 0 to 15 (decimal) are mandatory by definition, the first bit represents field ID 16. Starting with the LSB, bit 0 represents field ID 16, bit 1 represents field ID 17, etc. The bit is set to 1 if the field ID is supported; otherwise, it is set to zero. For example, if a service supports exactly four fields with IDs 16, 17, 30, and 31 (decimal), the array (in hexadecimal) is 2 bytes [03 c0].
Туре	0x11			1	List of Supported Response Fields
Length	Var			2	
Value	\rightarrow	uint8	response_fields_len	1	Number of sets of the following elements: • response_fields

Field	Field	Field	Parameter	Size	Description
	value	type		(byte)	
		uint8	response_fields	Var	This field describes which optional field
					IDs are supported in the QMI response.
					Its format is the same as request_fields.
Туре	0x12			1	List of Supported Indication Fields
Length	Var			2	
Value	\rightarrow	uint8	indication_fields_len	1	Number of sets of the following
					elements:
					• indication_fields
		uint8	indication_fields	Var	This field describes which optional field
					IDs are supported in the QMI indication.
					Its format is the same as request_fields.

Error codes

QMI_ERR_NONE	No error in the request
QMI_ERR_INTERNAL	Unexpected error occurred during processing
QMI_ERR_NO_MEMORY	Device could not allocate memory to formulate a response
QMI_ERR_REQUESTED_NUM_	Requested message ID is not supported by the currently
UNSUPPORTED	running software
QMI_ERR_MALFORMED_MSG	Message was not formulated correctly by the control point
	or the message was corrupted during transmission
QMI_ERR_INFO_UNAVAILABLE	Information is not available

3.4.3 Description of QMI_AUTH_GET_SUPPORTED_FIELDS REQ/RESP

This command queries the fields supported for a single command as implemented by the currently running software.

If the request, response, or indication is supported for the given message ID, the corresponding optional array is included in QMI_AUTH_GET_SUPPORTED_FIELDS_RESP, even if the message does not contain any optional fields. This enables the client to distinguish this case from one where the service does not support the request, response, or indication.

Examples are:

- If the specified message ID is not supported by the service, the response has qmi_result = QMI_RESULT_FAILURE and qmi_error = QMI_ERR_REQUESTED_NUM_UNSUPPORTED.
- If the specified message ID is an empty message, the response has qmi_result = QMI_RESULT_SUCCESS and qmi_error = QMI_ERR_NONE. None of the optional arrays are included.
- If the specified message ID supports the request with 0 optional fields, the response with 3 optional fields (16, 17, and 18 decimal), and does not support an indication, the response has the following:
 - qmi result = QMI RESULT SUCCESS
 - qmi_error = QMI_ERR_NONE
 - request_fields array is included with length zero

- response_fields array is included with length 1 value [07]
- indication_fields array is not included

Trailing zero bytes are omitted from the response. For example, if the message defines 20 different fields but the response only contains 16 bits, the client is to assume the last four fields are not supported.

QMI_AUTH_START_EAP_SESSION 3.5

Starts the EAP session.

QMI_ERR_NO_MEMORY	Device could not allocate memory to formulate a response
QMI_ERR_INVALID_ARG	Value field of one or more TLVs in the request message
	contains an invalid value
QMI_ERR_INVALID_OPERATION	Operation is invalid in the current state

3.5.3 Description of QMI_AUTH_START_EAP_SESSION REQ/RESP

This command starts an Extensible Authentication Protocol (EAP) session, after which control points can send EAP packets using the QMI_AUTH_SEND_EAP_PACKET command. The optional EAP Method Mask TLV can be used to set the EAP authentication method to either SIM (Subscriber Identity Module) or AKA (Authentication and Key Agreement).

This command creates the required handle with the required authentication method to allow control points to send the EAP packets using the QMI_AUTH_SEND_EAP_PACKET_REQ message.

If both the EAP Method Mask and EAP SIM AKA Algorithm TLVs are provided, the values must be consistent (e.g., an eap_method_mask value of 0x01 with an eap_sim_aka_algo value of 0x0001 results in QMI_ERR_INVALID_ARG. Also, an eap_method_mask value of 0x04 is to have an eap_sim_aka_algo value of 0x0002 or 0x0000; otherwise, the value results in OMI_ERR_INVALID_ARG).

All EAP methods are supported if neither eap_method_mask nor eap_sim_aka_algo is provided.

In multiple SIM scenarios, the subscription bound by QMI_AUTH_SET_SUBSCRIPTION_BINDING tells the authenticating layer the subscription on which this authentication is to occur.

After starting the EAP session, the client is not to assume a change in binding subscription until it stops the existing session and starts another, even if the client issued a set binding subscription request.

QMI AUTH SEND EAP PACKET 3.6

Sends and receives EAP packets.

Description of QMI AUTH SEND EAP PACKET REQ/RESP 3.6.3

This command is used by a control point to send an EAP packet after an EAP session is started. The response EAP packet for the request packet is returned in the QMI_AUTH_SEND_EAP_PACKET_RESP message. The EAP packet details are found in RFC 4187 and RFC 4186.

QMI_AUTH_EAP_SESSION_RESULT_IND

Communicates the result of the EAP session.

3.7.2 Description of QMI AUTH EAP SESSION RESULT IND

This indication communicates the result of the current EAP session to the control point that started the EAP session.

If the result is SUCCESS, the keys are available and the client must use the QMI_AUTH_GET_EAP_SESSION_KEYS command to query the keys.

The client can later end the current EAP session using the QMI_AUTH_END_EAP_SESSION command.

3.8 QMI AUTH GET EAP SESSION KEYS

Queries the EAP session keys.

QMI_ERR_MALFORMED_MSG	Message was not formulated correctly by the control point,
	or the message was corrupted during transmission
QMI_ERR_NO_MEMORY	Device could not allocate memory to formulate a response
QMI_ERR_INVALID_OPERATION	Operation is invalid in the current state

3.8.3 Description of QMI_AUTH_GET_EAP_SESSION_KEYS REQ/RESP

To extract the session keys:

- 1. The control point issues the QMI_AUTH_START_EAP_SESSION_REQ message.
- 2. If the start EAP session is successful, a QMI_AUTH_EAP_SESSION_RESULT_IND indication is sent to the control point to communicate that the session keys are available.
- 3. The control point uses the QMI_AUTH_GET_EAP_SESSION_KEYS_REQ message to retrieve the session keys.

3.9 QMI AUTH END EAP SESSION

Ends the EAP session.

QMI_ERR_INTERNAL	Unexpected error occurred during processing
QMI_ERR_MALFORMED_MSG	Message was not formulated correctly by the control point,
	or the message was corrupted during transmission
QMI_ERR_NO_MEMORY	Device could not allocate memory to formulate a response
QMI_ERR_INVALID_ARG	Value field of one or more TLVs in the request message
	contains an invalid value
QMI_ERR_MISSING_ARG	TLV was missing in the request

3.10.3 Description of QMI AUTH RUN AKA ALGO REQ/RESP

The control point uses this command to initiate the AKA algorithm (refer to RFC 4187 and RFC 4186) to generate the digest and AKA data.

When AKA_V1 or AKA_V2 is specified in the AKA Version TLV, the optional AKA_V1/V2 Authentication Parameters TLV must be present.

A success in the QMI_AUTH_RUN_AKA_ALGO_RESP message does not imply the algorithm completed successfully. The control point must process the QMI_AUTH_AKA_RESULT_IND indication to determine the outcome.

QMI AUTH AKA ALGO RESULT IND 3.11

Communicates the result of the AKA algorithm.

3.12.3 Description of QMI_AUTH_SET_SUBSCRIPTION_BINDING REQ/RESP

This command binds the current control point to a specific subscription. If a control point does not invoke this command to specify its binding, by default the control point is bound to the primary subscription. The control point uses this command to perform an operation or get information for a specific subscription.

For a primary subscription, bind_subs in TLV 0x01 must be set to "Primary subscription".

For a secondary subscription, bind_subs in TLV 0x01 must be set to "Secondary subscription". If the modem does not support the dual SIM dual standby feature, a QMI_ERR_OP_DEVICE_UNSUPPORTED error is returned.

For a tertiary subscription, bind_subs in TLV 0x01 must be set to "Tertiary subscription". If the modem does not support the triple SIM triple standby feature, a QMI_ERR_OP_DEVICE_UNSUPPORTED error is returned.

Note: The control point binding is only relevant to certain messages and its specific effect is documented in the description of those messages.

3.13 QMI AUTH GET BIND SUBSCRIPTION

Queries the subscription associated with the control point.

3.13.3 Description of QMI_AUTH_GET_BIND_SUBSCRIPTION REQ/RESP

This command queries the current subscription to which the control point is bound. If a set binding subscription request was not previously sent by this control point, by default AUTH_PRIMARY_SUBS is returned.

If this message is sent on a device that does not have support for multiple SIMs, a QMI_ERR_OP_DEVICE_UNSUPPORTED error is returned.

3.14 QMI_AUTH_EAP_NOTIFICATION_CODE_IND

Provides a notification code from the EAP server to the requested control point.
